

Project #3

Reason for using the list: One data structure in this project is an STL sequential container. The list and the vector were considered as containers. At the end, the STL sequential container was implemented using a list because it is easy to insert new data, just like with the vector, but it also makes it easy to sort the list. The result that is printed must be in alphabetical order, so it was important to be able to sort the list after inserting all the data.
